

Maximums (FT advice): Disks per VM = 16 FT VMs per host = 4 Minimum hosts per cluster = 3 FW Port Source Destination Prot (ESX port) Description UDP (SC) 8100, 8200 Hosts ESX/ESXi

TCP/UDP(SC) FT 8100, 8200 (out) ESX/ESXi Hosts FT uses anti-affinity rules. Requires - HA & host monitoring, host certificate checking (on by default), dedicated logging NIC, compatible CPU, Hardware Virtualization (HV), thick disks on shared storage. supported guest OS. Not supported - snapshots, storage VMotion, DRS features, hotplugging, MSCS, VCB, SMP, physical RDMs, Paravirtualized VMs, NPIV, VMDirectPath, EPT/RVI.

MSCS • Win 2000 SP4, 2003 SP2 & 2008 (Failover Clustering) • 32 & 64bit • only 2 nodes clusters Not supported - DRS or HA cluster, VMotion, FT, NPIV, Round Robin NMP, iSCSI/NFS based disks

ı		VIVIDA	VIRTUAL KDM	Physical RDM
ı	Cluster in a box (CIB)	Yes (zeroed)	Yes	No (not supported)
ı	Cluster across boxes (CAB)	No	Yes - not Win2008, not CCR	Yes (recommended
ı	Physical & VM (n+1)	No	No	Yes
	Snapshots	Yes	Yes	No
	SCSI target software	No	No	Yes
ı	0 0 11 11 11 11 1	a		****

· Configure all RDMs before configuring VM's network settings, or initialising LUNs within windows Add all RDMs to a 2nd SCSI controller i.e. SCSI(1:x). Set sharing to Physical or Virtual as required. SCSI bus sharing • CIB = Virtual • CAB or N+1 = Physical

http://kb.vmware.com/kb/1010550 - vCenter server in a MSCS

Maximums (per host): 1GB VMNICs = 2 - 32 dependent on HW (e1000/e=32) 10GB VMNICs = 4 PCI VMDirectPath devices = 8 vSS switches = 248 vSwitch ports (vSS or vDS) = 4,096 Service Console ports = 16 VMotion (VMkernel) ports = 1 IP storage (VMkernel) ports = 1 Maximums (per vCenter): vDS switches = 16 vDS port groups = 512 vDS switch ports = 6,000 Maximums (per switch): Hosts (per vDS) = 64 vSS port groups = 512 vSS switch ports = 4,088 VMNICs - logical names for physical NICs on server, vNICs - virtual NICs assigned to VMs.

vSS - virtual Standard Switch, vDS - virtual Distributed Switch, vdPort - port group on a vDS

Common networking commands (-h switch for options or man page for detailed description): List VMNICs: \$ sudo /usr/sbin/esxcfg-nics -1 \$ sudo /usr/sbin/esxcfg-vswitch -1 List vSwitches & Port Groups: List Service Console ports: \$ sudo /usr/sbin/esxcfq-vswif -1 List VMkernel ports: \$ sudo /usr/sbin/esxcfg-vmknic -1 List VMkernel Default Gateway: \$ sudo /usr/sbin/esxcfg-route

Common networking configuration files: Name resolution order: /etc/nsswitch.conf Local host file: /etc/hosts DNS servers: /etc/resolv.conf DG: /etc/sysconfig/network Ethernet tagging: • EST (External Switch Tagging) - Default. No trunking required. 1-1 relationship from VMNICs to physical switch ports. Each VMNIC can only see 1 subnet. VLAN ID of 0 or blank. • VST (Virtual Switch Tagging) - Commonly used. VMNICs connected to a vSwitch can span several VLANs. Each Port Group has a VLAN ID of 1-4094. Set the VLAN ID to blank to use Native VLAN. • VGT (Virtual Guest Tagging) - Rarely used. Install 802.1Q trunking driver software in the VMs, & the vSwitch preserve the tags given by the VMs. VLAN ID of 4095 on vSS, VLAN policy on vDS. Avoid using a VLAN ID of 1, as this is the native Cisco VLAN ID.

vSS & vDS options (options can also be overridden on individual Port Groups):

General • Number of ports - by default 56 for vSS, 64 for vDS, 128 when created on Sevice Console. (not a Port Group option) • Network label & VLAN ID - only on Port Groups not vSwitches.

Security • Promiscuous mode (default Reject) - only listens to traffic destined for its MAC address. • MAC Address Changes (default Accept) - accepts inbound frames when VM changes MAC address. • Forged Transmits (default Accept) - won't drops outbound frames if source MAC address is different

Traffic Shaping • Status (default Disabled) Average Bandwidth (default 102400 Kbps) Peak Bandwidth (default 102400 Kbps) Burst size (default 102400 KB) - shapes out on vSS, in/out on vDS. NIC Teaming • Load Balancing (spreads outbound traffic from vNICs across VMNICs) - Originating port ID (default) uses VMNIC based on where traffic entered - ip hash based on source & destination IF address of each packet. Use when physical switch ports are etherchannel - Source MAC hash based on source MAC address - Use explicit failover order. Incoming traffic is load balanced by physical switch.

• Network Failover Detection Link status only (default) detects cable pulls & switch power failures, not misconfigurations. Beacon Probing don't use with IP-hash load balancing.

• Notify Switches - No or Yes (default) updates lookup tables. Disable for MS NLB in unicast mode.

• Failback - No or Yes (default) VMNIC will return after recovering from a failure.

• Failover order Active - Standby - Unused. Don't use standby uplinks with IP-hash load balancing. VLAN (vDS only) • VLAN - Trunk range - Private VLAN. Join private VLAN to physical VLANs.

Miscellaneous (vDS only) • Port blocking - selected or unselected (default) block all ports. dvPort options: • Port Binding Static when initially connected Dynamic when connected/powered-on Ephemeral no binding • Traffic shaping Ingress vNIC to vSwitch Egress vSwitch to vNIC • Allow live port moving • Config reset at disconnect • Host can assign port if vCenter is down • Name format

TSO (TCP Segmentation Offload): enabled by default on VMkernel ports, allows very large frames (up to 64KB), even with smaller MTU. To enable on VMs, they need enhanced vmxnet vNIC. Jumbo frames up to 9kB. Must be enabled for each vSwitch. VMs need enhanced vmxnet to use it.

NetQueue enabled by default, allows certain VMNICs to spread processing across multiple CPUs.

Configure networking: (1) add a vSwitch esxcfg-vswitch -a (2) add a port group to the vSwitch esxcfg-vswitch -A (3) set the port group's VLAN ID esxcfg-vswitch -p -v (4) add the VMNIC to the vSwitch esxcfg-vswitch -L

· VM connections: set the VM's NIC to use the port group.

• Service Console: create interface & add it to the port group esxcfq-vswif -a -p -i -n, set the DG in /etc/sysconfig/network, then restart networking service network restart.

• VMkernel ports: add the port esxcfg-vmknic -a -i -n & set the VMkernel DG esxcfq-route. VMotion should be be enabled in VC if required.

http://vmware.com/files/pdf/vsphere-vnetwork-ds-migration-configuration-wp.pdf - vDS whitepaper

Maximums (per DRS cluster): Hosts = 32 VMs (powered on) = 1280 (limit of 256 per host) Maximums (per Resource Pool): Children = 1024 Tree depth = 12 (10 when in a DRS cluster) Maximums (other): Datacenters per host = 100 RPs per host = 4096 RPs per cluster = 512

Datacenters mark organisational & VMotion boundaries. Clusters gather host CPU & memory resources. Resource Pools apply policies to clusters. A DRS cluster is also implicitly a resource pool. Resource pools: • Shares - low, medium & high (1,2,4) • Reservations - MHz(CPU)/MB(RAM) • Limits - MHz/MB • Expandable reservation - yes (can draw from parent's pool) - no (can only draw from own pool). List the resource group settings: \$ sudo /usr/sbin/esxcfg-resgrp -1 Shares only apply during contention. Shares are relative to siblings. Reservations guarantee a minimum, are only checked when a VM is powered on. Limits are an upper bound, never exceeded; manage user expectations but can waste idle resources. Expandable reservations do not automatically hunt upwards, define if reservations are considered by admission control. Child pools actively reserve resources from parent even if VMs are powered off. Hierarchical resource pools require DRS enabled. DRS has 5 priority levels 1-5 (1 the highest). DRS cluster settings: • Manual • Partial (Initial VM placement) • Fully Automated (Initial VM placement & Dynamic balancing)

"Grafted from" pools created when adding a host to a DRS cluster & keeping the host's resource pool hierarchy. Maintenance mode only clears VMs off host if DRS cluster is fully automated. Affinity Rules keep VMs together or apart in a DRS cluster. Anti-affinity rule limited to 2. Rule conflicts - older wins, newer rule disabled. Anti-affinity wins over affinity. Disabled rules ignored. DPM uses IPMI, iLO or WOL (in that order). DRS & DPM thresholds are independent. Verify host's DPM Last Time Exited Standby. DPM level - Off, Manual (makes recommendations) & Automatic. Hosts reclaim memory from VMs by: • Balloon driver (vmmemctl) force guest to use native algorithms (guest swap) • VM Swap files (if vmmemctl not available/responsive) • Sharing memory across VMs Links: http://kb.vmware.com/kb/1005764 - Enhanced VMotion (EVC) FAQ

http://kb.vmware.com/kb/1003212 - EVC CPU compatibility

Rescan iSCSI LUNs:

Maximums (per host): Volumes = 256 Paths = 1024 NAS datastores = 8 (32 with adv settings) paths to each LUN = 16 FC - HBAs = 8 (HBA ports = 16) targets per HBA = 256 targets per HBA = 64 Dynamic (61 Static) paths to each LUN = 8 iSCSI HW - HBAs = 4 iSCSI SW - NICs = 8 targets = 256 paths to each LUN = 8 Maximums (per volume): VMs = 256 Hosts = 64 (DRS limit, 2048 for linked clones) Volume size = 64TB (NFS=16TB) File size (1/2/4/8MB block size) = 256GB/512GB/1TB/2TB

RDMs = 2TB (less 512B)Extents = 32Extent size = 2TB (less 512B) FW Port Source Destination Prot (ESX port) Description 2049 NFS server ESX/ESXi TCP (VMK) NFS Client 2049 (out) NFS server TCP (VMK) NFS Client ESX/ESXi 3260 (out) ESX/ESXi iSCSI server UDP (SC+VMK) iSCSI Client

Common storage commands (-h switch for options, or man page for detailed description): List all storage devices: \$ sudo /usr/sbin/esxcfg-scsidevs -c List LUNs, paths & multipathing plugins: \$ sudo /usr/sbin/esxcfq-mpath -L List all VMware SATPs: \$ sudo /usr/sbin/esxcli nmp satp list \$ sudo /usr/sbin/esxcli corestorage claimrule list List claim rules: Lists datastores, dev names to VMFS: \$ sudo /usr/sbin/esxcfq-scsidevs -m List snapshot volumes: \$ sudo /usr/sbin/esxcfg-volume -1 Test VMkernel connectivity: \$ /usr/sbin/vmkping Manage HW iSCSI (Ologic) settings: \$ sudo /usr/sbin/esxcfq-hwiscsi -1 Manage SW iSCSI settings: \$ sudo /usr/sbin/esxcfq-swiscsi -q List iSCSI LUNs: \$ sudo /usr/sbin/vmkiscsi-tool -L -l adapter

List the NFS exports from the VMkernel: \$ sudo /usr/sbin/esxcfg-nas -1 iSCSI NAS Storage capabilities VMotion, DRS, HA, FT, VCB, SRM & Thin VMDKs Yes Yes Yes VMFS volumes, RDMs & VMware's NMP Yes No Yes Boot ESX host Yes Yes (HW initiator) No VM MSCS clustering Yes

\$ sudo /usr/sbin/esxcfg-rescan adapter

LUN masking: done at the SP or server. Zoning: at the switch.

Active-active: access to the LUNs similtanously through all ports, without performance degradation. Active-passive: one port actively providing access, other as backup. Path thrashing can occur. NPIV (N-Port ID Virtualization): FC HBA port assigns dedicated virtual port (WWPN) to VM (RDM) Runtime Name vmhba#:C#:T#:L# - adapter:channel:target:LUN LUN addressing FC: iSCSI: IQN iqn.year-mo.reversed domain name:string or EUI eui.string

iSCSI discovery methods: Static - can manually add/remove items, only with hardware initiators. Dynamic - uses "SendTargets", target responds with list. Removed targets return after HBA rescan/reset CHAP: HW iSCSI 1-way CHAP, initiator level. SW iSCSI 1-way & mutual CHAP, initiator or target VMkernel Port is required to use iSCSI or NFS storage. (S.C. port not required for iSCSI anymore) MPP (MultiPathing Plugins): claim rules in /etc/vmware/esx.conf specify MPP to use for each path.

Claim rules: indicate which MPP, native or 3<sup>rd</sup> party, manages a given physical path. NMP (Native MPP): includes SATPs (Storage Array Type Plugins) & PSPs (Path Selection Plugins) NMP policies: Fixed - default for active/active, uses preferred path when available

MRU (Most Recently Used) - default for active/passive (& iSCSI), first working path found at boot RR (Round Robin) - safe for all arrays - load balances by rotating through paths (not for MSCS LUNs) Disk.MaxLUN: reduce number of LUNs scanned. Disk.MaskLUN: convert to claim rule VMFS volumes: Large=less LUNs to create, less to manage, flexible resizing & snapshots. Small=less

contention (locking), less wasted space, different RAIDs, more flexible multipathing & disk shares. Links: http://kb.vmware.com/kb/1003659 - Troubleshooting shared storage issues (ESX3)

by Forbes Guthrie Version 1.0 for v4.0

HW requirements: • 64-bit x86 CPUs • 2GB RAM minimum • see HCL (link below) Installation log: /var/log/esx install.log IPv6 is not supported.

Evaluation period (60 days) starts on first power-on even if host is licensed. Install boot options: F2. Install Media Depot can be accessed via HTTP/HTTPS, FTP, or NFS - askmedia boot option. PXE Boot the install: (1) Install TFTP server software (2) Put menu.c32 file in accessible place (3) Install PXELINUX (4) Configure DHCP server (5) Copy vmlinuz & initrd.img from /isolinux on DVD (6) Create /tftpboot/pxelinux.cfg on TFTP server.

Install script can be: Default script (on DVD), FTP, HTTP/HTTPS, NFS, USB flash drive, local disk. Default install scripts: • ks-first.cfg installs on 1st disk • ks-first-safe.cfg same but keeps VMFS. Root password is "mypassword". Interactive install creates /root/ks.cfg from choices made.

Physical partitions: • /boot, vmkcore & /vmfs • exconsole.vmdk: /, swap, /var/log, & optional ones. Size of /boot, vmkcore & VMFS cannot be defined/changed during Interactive install (can in Scripted). Disconnect Fibre Channel connections prior to installation.

Mount point	Format	Default	Location
/boot	ext3	1100MB	Primary physical partition
	vmkcore	110MB	Primary physical partition
/vmfs	vmfs3	fill remaining 1st disk	Logical physical partition
1	ext3	5GB (if /usr in own partition, may be larger)	esxconsole.vmdk file
	swap	1200MB default (max 1600MB)	esxconsole.vmdk file
/home	ext3	optional - recommended 512MB	esxconsole.vmdk file
/tmp	ext3	optional - recommended 1024MB	esxconsole.vmdk file
/usr	ext3	optional - no recommendation	esxconsole.vmdk file
/var/log	ext3	optional - recommended 2000MB	esxconsole.vmdk file
vReference rec	ommends: /h	ome, /opt, /tmp - min 2GB each, /var (no /var/le	og) - 5GB, swap - 1600MB

Post install tasks: • Reconnect FC connections.

- Create user account & add to sudoer file (visudo add to "user privilege specification").
- Test cables are in correct VMNICs: \$ watch -n 1 'sudo /usr/sbin/esxcfg-nics -1'
- Rearrange VMNICs in /etc/vmware/esx.conf if required (reboot required).
- · Adjust Service Console memory to 800MB (reboot required).
- · Configure NTP (time) settings.
- · Patch (see ESX Hosts section).
- · Connect vSphere Client to host (not VC) & add extra users (the sudo users) to Administrators group.
- · Configure vSwitches.
- Configure storage (& set DiskMaxLUN as required).
- Connect vSphere Client to VC, add new host, move to required cluster.
- · License host.
- · Enable Web access if required.

Upgrade from ESX3: • VUM (vCenter Update Manager) - upgrades ESX & ESXi (see VUM section) • Host Update Utility - upgrades ESX & ESXi (& updates ESXi), small environments (< 10 hosts, no VUM). Customize in %PROGRAMFILES%\VMware\Infrastructure\VIUpdate 4.0\settings.config

 esxupgrade.sh script http://kb.vmware.com/kb/1009440 - upgrades ESX only. • Updates only (not upgrades): vihostupdate updates ESX & ESXi, esxupdate updates ESX.

Upgrade logs: /esx3-installation/esx4-upgrade/ & /var/log/vmware/ Unsuccessful upgrades: /esx4-upgrade/ & /var/log/vmware/

Post upgrade: • Upgrade VMware Tools before upgrading virtual hardware.

• Convert LUN masking to claim rule format: esxcli corestorage claimrule convert

• Successful upgrade: cleanup-esx3 removes ESX3 boot options & ability to roll back.

Possible extras: 22/135/137-139/445/9089(guided consolidation),25(SMTP),53(DNS),80(redirects), 88/445(AD),161/162(SNMP),389(LDAP),636(Linked VCs),1433(MSSQL),1521(Oracle), 8080/8443(webservices),8181/8182(collector service),27000/27010(license 3.x hosts).

Logs: DB upgrade: %TEMP%\VCDatabaseUpgrade.log VC agent: /var/log/vmware/vpx/vpxa.log VC install: %TEMP%\ directory of user installing VC VC logs: %TEMP%\vpx\vpx\d-#.log

Default roles (System roles - permanent, cannot change privileges, ESX/ESXi & VC. Sample just VC): No access System - Default except users in Admin Group. Cannot view or change.

Read only System - View state & details except console tab.

Administrator System - All privileges. Default for members of the Admin Group. VM power user Sample - Interact with, change VM settings, snapshots & schedule tasks. VM user Sample - Interact with, insert media & power ops, Not changeVM settings,

Resource pool admin Sample - Create, modify child pools & assign VMs, but not RP itself. Consolidated backup user Sample - Used by Consolidated Backup product, don't modify.

Datastore consumer Sample - Allows use of the datastore.

Sample - Allows network to be assigned to hosts or VMs. Network consumer

Permissions: Assigning - pair user/group with role & associate with object. Role - predefined set of privileges. Users initially granted No Access role on new objects, including datastores/networks. Logged in users removed from domain keep permissions until next validation period (default 24 hrs). Tasks - activities that don't complete immediately. All roles allow schedule tasks by default. Can schedule tasks if user has permission when tasks created. VC Local Administrators have same rights as Administrator role by default, root & vpxuser are only users not assigned No Access role on hosts by default. Propagation is per permission, not universal. Child permissions override those propagated. User permissions override Group ones. Can't set vDS permissions, set on parent & propagate.

Licenses	ESXi Single	Essential	Essential+	Standard	Advanced	Enterprise	Enterprise-
vCenter	Esse	entials	Foun	dation & Sta	ındard editi	ons	
Cores per socket	6	6	6	6	12	6	12
vSMP	4-way	4-way	4-way	4-way	4-way	4-way	8-way
Physical RAM	256GB	56GB	256GB	256GB	256GB	256GB	no limit

HA			Yes	Yes	Yes	Yes	Yes
Data Recovery			Yes		Yes	Yes	Yes
Hot Add, FT, vShield,	VMotion				Yes	Yes	Yes
Storage VMotion, DR	S					Yes	Yes
vDS Host Profiles 3r	d party MM	р					Ves

Licensing: 25-character license keys, managed in VC. vSphere (ESX/ESXi) & vCenter Licenses. Expiring licenses: vCenter - hosts are disconnected. ESX/ESXi - VMs run, but cannot power-on/reset. Statistics: CPU, memory, disk, network, system, & VM ops. Collection Intervals (time stats - archived in DB): 5mins - 1 day, 30 mins - 1 week, 2 hrs - 1 month, 1 day - 1 year. Real-time stats stored in flat file on hosts & VC memory (not in DB), collected every 20 seconds. ESX - kept for 1 hr, ESXi - kept for 30 mins. Collection level 1-4 for each interval, 4 has most counters (default is 1). Datastore metrics only available in overview charts (not advanced charts). Reports & Maps updated every 30 mins.

Alarms: notifications of selected events, conditions & states. Composed of trigger & action. Triggers: condition/state triggers (monitor VMs, hosts & datastores - equal to/not equal to & above/below) & event triggers (any object, VC or license server - arguments, operators & values). Actions: responses to triggered alarms. Default alarms don't have actions associated. Can disable action without disabling alarm, but effects actions on all alarms. Disable for selected object, child continues. Reduce alarms with tolerance range & trigger frequency (default 5 mins). Disconnect hosts to suspend monitoring.

Linked mode: joins VCs. Global data: IP & ports, certificates, licensing, user roles, Uses ADAM (AD App Mode) to store & sync data. Instances can run under different domain accounts. Installed by domain user who is admin on both machines. Requirements: DNS, 2-way trust if different domains, time sync, DNS name matches hostname. Roles are replicated, assignments of roles are not.

Host profiles: eliminates per-host configuration & enforces consistency. Requires Enterprise + license. Exported profiles are .vpf files. Links: http://kb.vmware.com/kb/1011641 - Collecting diagnostic information for vCenter

Maximums (per VM): vCPUs = 8RAM = 255GBSwap file = 255GB (1 per VM) SCSI adapters = 4 Devices per SCSI adapter = 15 IDE devices (disk or CD) = 4 Floppy drives = 2 vNICs = 10Parallel ports = 3 Serial ports = 4 Remote consoles = 40 VMDirectPath devices = 2 VMDirectPath SCSI targets = 60 Files: .cfg Earlier version of .vmx file vmem VM's memory dsk Earlier version of .vmdk file vmsd Snapshot metadata .hlog VMotion log file vmsn Snapshot state file .lck-XXX Locking file on NFS datastore vmss Suspended state file VM activity log Earlier version of VC template .log vmtd BIOS settings .nvram vmtm Team data .raw Raw device e.g. tape device vmtx VC template header .vmx Primary configuration file .rdm RDM in Virtual Compatibility mode RDM in Physical Compatibility mode | .vmxf | Extra configuration file for VMs in a team .rdmp Earlier version of -delta.vmdk file .REDO .vswp Swap file for overcommitted memory .std Earlier version of .vmss file .vmdk Disk descriptor (also raw virtual disk for hosted products) -flat vmdk Raw virtual disks 00000#.vmdk Snapshot metadata 00000#-delta.vmdk Snapshot differential file Logs: VM log /vmfs/volumes/datastore\_name/vm\_name/vmware.log

Commands: List all registered VMs on a host: \$ sudo /usr/bin/vmware-cmc Create/modify VMDKs, RDMs, VMFS volumes & storage devices: vmkfstools (check man page) Power Off = hard power off • Shut Down = soft with VMware tools • Reset = hard • Restart = soft VM HW: Memory/CPU Hotplug – VMware Tools must be installed.

VMs with HW earlier than v4 have reduced performance & capabilities. Cannot add/remove devices. Manually MAC addresses: 00:50:56:x:y:z. Set in vmx; ethernet<number>.addressType="static". Disks: Thick provisioned - default format, required for clustering such as FT or MSCS, cannot convert to thin (can via storage VMotion). Thin provisioned - saves space, can manually convert to thick. RDM: Benefits User-Friendly Persistent Names, Dynamic Name Resolution, Distributed File Locking, File Permissions, File System Ops, SAN Snapshots, vMotion, SAN mgt agents & NPIV. Limitations not for block devices, no snapshots with physical RDMs, no partition mapping, needs whole LUN. Snapshots:capture memory state, settings & disks. Can't snapshot physical RDMs or independent disks Snapshot Manager: Delete commits snapshot to parent. Delete all commits all snapshots before You are here. Go to reverts to that snapshot. Revert to snapshot back to parent's snapshot You are here. VMotion: To VMotion a suspended VM, new host must meet CPU compatibility requirements. Storage VMotion: can transform thick > thin or thin > thick. Limitations: VMs cannot have snapshots,

only persistent VMDKs or RDMs, requires license, ESX3.5 hosts need VMotion licensed/configured. VMI (VM Interface) paravirtualization: standard to improve performance, only Linux 32bit guests. Uses a PCI slot. VMI VM must be off to move to an unsupported host; can reduce performance. VMDirectPath: I/O allows guest OS to access physical PCI/PCIe devices, Intel Nehalem platforms. Restrictions: VMotion, Hot add/remove, suspend, record/replay, FT, HA, DRS (but allowed in cluster). SCSI controllers: • BusLogic Parallel • LSI Logic SAS • LSI Logic Parallel • PVSCSI PVSCSI (Paravirtual SCSI): high-performance storage adapter. Not recommended for DAS. Guests:

Win 2003, 2008, RHEL5. Not supported: Boot disks, Record/Replay, FT, MSCS. NPIV (N-port ID virtualization): share FC HBA port as multiple virtual ports, each with unique IDs. VMs assigned 4 WWNs, Limitations: NPIV enabled FC switch, only RDMs, HBAs need access to

LUN using its WWNs, NPIV capable HBAs, no Storage VMotion, VM can't power on if WWNs in use vNICs: • Flexible - 32-bit guests, vlance without VMware Tools or vmxnet with VMware Tools • e1000 - Emulates E1000 NIC, default for 64-bit guests • Enhanced vmxnet - vmxnet with enhanced performance, requires VMware Tools • vmxnet3 - vmxnet with enhanced performance & networking features, requires VMware Tools & HW v7, doesn't support FT.

TSO (TCP Segmentation Offload): enabled in VMkernel by default, must be enabled at VM level. Needs enhanced vmxnet, might change the MAC. Jumbo frame support requires enhanced vmxnet. OVF: templates can be deployed from a local file system via the Client, or from a web server. OVF files are compressed. Client validates the OVF file before importing it.

vApp: container containing one or more VMs, can power on & off, & be cloned. Metadata in VC's DB. IP pool - network configuration assigned to network used by vApp. VC then provides IPs to its VMs. Links: http://kb.vmware.com/kb/1010048 - Set all VMs to upgrade tools at next power on

http://kb.vmware.com/kb/1004231 - Recreate missing disk header file

Maximums (per HA cluster): Hosts = 32 VMs = 1280 (max 100 per host, but > 40 limits hosts to 8) Failover hosts = 4 (only 5 primaries), or 50% of hosts if less than 8

FW Port Source Destination Prot (ESX port) Description 2050-2250 Hosts ESX/ESXi UDP (SC) TCP/UDP(SC) HA 2050-2250 (out) ESX/ESXi Hosts 8042-8045 Hosts ESX/ESXi UDP (SC) HA 8042-8045 (out) ESX/ESXi TCP/UDP(SC) HA Hosts Logs: HA logs: /var/log/vmware/aam.

HA primary hosts (first 5): maintain & replicate cluster state and initiate failover actions. Active primary host: decides where to restart VMs, tracks & effects failed restart attempts.

List primary hosts: \$ cat /var/log/vmware/aam/aam config util listnodes.log Seconday host promoted after primary is: • maint mode • disconnected • removed - not on failure

Host isolated: no heartbeat for 12 seconds, then cannot ping isolation addresses. Isolation response: • power off • leave powered on • shut down (default). However Host Failure is only after 15 seconds. Admission Control types: • Host • Resource Pool • HA (only HA admission control can be disabled) Admission Control: rules if VMs can power on when they violate availability constraints at HA failurer. Actions that change a reservation must satisfy admission control.

HA Admission Ctrl policies: Host Failures Cluster Tolerates (1-4 hosts), % of Cluster Resources (up to 50%), Specify a Failover Host. Policy Factors • resource fragmentation • flexibility • VM diversity Slot size: represents VM CPU & memory resources needed for any powered on VM. Distorted by large VM reservations. Avoided with advanced attributes das.slotCpuInMHz or das.slotMemInMB
